PROJECT OVERVIEW

This project delivers a robust, scalable, and mobile-first TankToppa platform designed to help drivers minimise fuel costs through intelligent, data-driven refuelling decisions. The system is built to evolve from a launch-ready MVP into a sophisticated, AI-driven fuel optimization engine.

Phase 1 focuses on establishing a fast, stable, and user-friendly application that enables drivers to plan journeys and receive optimized fuelling recommendations based on route data, fuel prices, and vehicle-specific parameters. The platform will feature a clean, intuitive interface tailored for real-world driving scenarios, ensuring minimal friction from trip input to actionable fuel strategy.

Built using modern, scalable architecture and API-first principles, the foundation emphasizes performance, accuracy, and maintainability. This ensures a seamless user experience from route planning through fuelling decision execution while preparing the system for future enhancements such as automation, predictive analytics, and mobile-native expansion.

CONFIDENTIALITY STATEMENT

This document is copyright-protected and the property of Emizentech Pvt. Ltd and is intended for internal use only. This document contains commercially sensitive information and must not be made available to any individual or organization outside Emizentech Pvt. Ltd and client without written permission from Emizentech Pvt. Ltd unauthorized disclosure may result in penalties and/or disciplinary action. Client will be the sole owner of all the rights to the intellectual property (which is not available already) developed at the end of this contract. Transfer of rights will be done after successful completion & timely payment of each milestone.

USER PANEL

- Public User
 - Mobile Application (Android & IOS)
- Admin
 - Web Panel

ABOUT US

Emizen Tech is widely known for implementing the best industrial processes and technologies to assist clients in transforming their vision into actionable software solutions and a successful business model.

Besides, Emizen Tech emerges with the best possible way to help all-sized businesses and enterprises worldwide develop, maintain, and upgrade their IT infrastructure.

SCOPE OF WORK

USER TYPE: Mobile Application (PHASE 1)		
1.	Entry Point & App Launch	When a user opens the TankToppa mobile application, the app initializes and prepares the environment for route planning. - The app requests location (GPS) permission - If allowed: Auto-detect current location - If denied: User proceeds with manual input - The user lands on the main route input screen - No login/signup required (as per MVP scope)
2.	Route Input Flow	Route Planning (What the user sees) - Input Fields - Start Location: - Auto-filled via GPS OR manual entry - Destination: - Search enabled (Google Places API) - UI Elements "From" and "To" input fields - Map preview (optional background) - Primary CTA "Find Route" - Click → - Fetches route via Google Maps API - Redirects to route display screen - If route fails: - Show message: <i>"Unable to fetch route. Please try again."</i>
3.	Route Display Flow	Route Overview Once the route is generated: - The user sees: - Route drawn on map - Total distance - Estimated travel time - Layout includes: - Full map view - Route summary panel - CTA: "Next: Enter Vehicle Details" "Next" CTA enabled only after route loads successfully
4.	Vehicle & Fuel Input (Core Differentiator)	Vehicle Input Screen User provides key inputs required for optimization:

		- Fuel tank size OR vehicle type - Current fuel level (% or litres) - Optional: - Fuel consumption (L/100 km) UI Behavior: - Simple input fields / sliders - Helper hints for better accuracy Primary CTA: “Calculate Best Stop” System Action: - Inputs are temporarily stored for session based calculation and are not persisted in database in MVP phase - Initiates fuel optimization logic
5.	Fuel Stations Along Route	Stations Display The system identifies fuel stations along the selected route. - Displays 3–5 relevant stations along the route (based on route corridor filtering) Each station includes: - Station name - Fuel price (mock/sample data) - Map marker - Estimated detour distance/time (simplified – extra distance to leave and rejoin the route) If no stations found: - Show message: <i>“No fuel stations found on this route”</i> UI Layout: - Map with location pins - Scrollable list of stations
6.	Fuel Range Calculation	Background Processing The system performs calculations in the background: - Estimated driving range - Fuel consumption vs distance - Reachable fuel stations - Estimated detour distance for each station (simplified calculation) - Estimated extra fuel required for detour based on user inputs - Estimated detour fuel cost (based on extra fuel required)

		User Experience: - Optional loader (“Calculating...”) Outcome: - Fuel Optimization Engine (Backend Processing)
	Fuel Optimization Engine (Backend Processing)	The core optimization logic is handled via backend processing to ensure accuracy and scalability. - Route data and user inputs are sent to the backend - The backend performs: - Route-based station filtering (corridor approach) - Simplified detour calculation (leave and rejoin route distance) - Extra fuel consumption estimation - Detour fuel cost calculation - Effective fuel price calculation (fuel price + detour cost) - The backend returns: - Filtered stations - Detour estimates - Effective cost comparison - Recommended best station
7.	Best Stop Recommendation	Decision Engine Output The system evaluates stations based on: - Fuel price - Distance from route - Reachability - Estimated detour fuel cost - Effective fuel price (fuel price + detour cost) Output Behavior: - Highlights the best station on the map based on lowest effective cost - Marks other stations as alternatives
8.	Recommendation Display	Final Output (What the user sees) Example: “Best Stop: Shell Goulburn – Save \$6” Additional details: - Distance to station - Estimated savings - Remaining fuel on arrival - Detour impact (e.g., extra distance / estimated added cost) - Effective price comparison (adjusted cost after detour) User Actions:

		• View station details • Interact with map
9.	Map Interaction (Optional)	User Exploration Users can: • Tap on different stations • Compare fuel prices • View location details This allows users to make informed decisions beyond the recommendation
ADMIN PANEL		
1.	Secure Access	Admin logs in via web panel Authentication required (email/password)
2.	Dashboard Overview	Admin can view: • Total Route Searches ◦ Number of times users calculated routes • System Status ◦ Google Maps API status (working / error) ◦ Backend status (running / failed) • Recent Activity (Optional)
3.	Logs / Error Monitoring	Basic Debugging Admin can view simple logs: • API failures (e.g., map not loading) • Route calculation errors • System warnings Purpose: • Identify issues quickly • Ensure smooth app performance
4.	Admin panel is monitoring-only and does not include fuel station management. All station data is dynamically fetched and processed via APIs and backend logic.	

OUT OF SCOPE:

- Live fuel data integration
- Price prediction
- Multi-stop optimisation (*optimising multiple refuelling stops across entire route*)
- Accounts / login
- Notifications

DEVELOPMENT APPROACH

We follow **Agile methodology** for software development. It is an iterative and collaborative approach to software development that prioritizes customer collaboration, adaptability, and incremental delivery. It emphasizes breaking the project into small, manageable increments called sprints, typically lasting 2-4 weeks.

- **Proposed Agile Process:**

- **Sprint Duration:** Our proposed sprint duration will be 3-4 weeks, allowing for rapid iteration and feedback.
- **Sprint Planning:** At the beginning of each sprint, our team will conduct sprint planning meetings to define sprint goals and select user stories from the product backlog for implementation.
- **Daily Stand-ups:** Daily stand-up meetings will be held to discuss progress, obstacles, and plans for the day, ensuring that the team stays aligned and focused.
- **Sprint Review and Demo:** At the end of each sprint, we will conduct sprint review and demo sessions to showcase completed work to stakeholders and gather feedback for iteration.
- **Retrospectives:** Regular retrospectives will be held to reflect on our processes, identify areas for improvement, and make adjustments for future sprints.

- **Roles and Responsibilities:**

- **Product Owner**: Your designated Product Owner will be responsible for prioritizing the product backlog, providing feedback, and making decisions on behalf of the customer.
- **Scrum Master (if applicable)**: Our Scrum Master will facilitate Agile ceremonies, remove obstacles, and foster collaboration within the team.
- **Development Team**: Our cross-functional development team will be responsible for delivering high-quality increments of the product during each sprint.

- **Communication and Collaboration:**

- As agile promotes open communication and collaboration among team members and stakeholders. We will maintain regular interactions, feedback loops, and transparency to ensure everyone is aligned and informed throughout the project

- **Risk Management:**

Agile methodology provides greater visibility, early issue identification, and the ability to adapt to changing circumstances, mitigating project risks and ensuring successful delivery.

- **Benefits of Agile:**

RESOURCE ALLOCATION

S. No.	Type of Resource	No of Resources	Involvement in Project	Responsibilities
1.	Business Analyst	1	Part Time	Responsible for point of contact between client and development team to share the timely updates.
2.	Mobile Developer	1	Full Time	Responsible for leading and executing the technical aspects of the project.
3.	Backend Developer	1	Full Time	Responsible for translating business requirements into effective technical solutions.
4.	QA Engineer	1	Part Time	Responsible for overall reliability and web app performance and ensure the web app meets quality standards.

SPRINT PLANNING

S. No.	Sprint	Sprint Focus	Modules / Deliverables	Sprint Cost
1.	Sprint 1	Core App & Route Setup	Tasks: - Mobile app setup (React Native project structure & navigation) - Google Maps SDK integration - Location permission handling (GPS allow/deny flow) - Route input screen (Start & Destination via Google Places) - Route generation & display (map, distance, estimated time) - Backend setup (Node.js – basic API structure) Route polyline extraction for further processing	\$1,800
2.	Sprint 2	Station Filtering & Display	Tasks: - Integration of static/mock fuel station dataset (API ready structure) - Route corridor-based filtering (identify stations near route) - Backend APIs for station retrieval - Display stations on map (markers) - Station list view (name, price, basic details)	\$2000
3.	Sprint 3	Simplified Optimization Engine	Tasks: - Fuel input handling (tank size, fuel level, consumption) - Fuel range calculation - Reachability filtering (which stations can be reached) - Simplified detour estimation (approximate extra distance) - Detour fuel cost calculation (basic estimation)	\$2200
4.	Sprint 4	Recommendation, QA & Deployment	Tasks: - Effective fuel price calculation (fuel price + detour cost) - Ranking logic to select best station - Recommendation UI (highlight best stop, show savings) - UX improvements (loaders, messages, edge cases) - QA testing (functional + basic edge scenarios) - Build generation (Android & iOS)	\$1500

			Deployment support (TestFlight / APK delivery)	
	Total			7500 USD

TECH STACK SUMMARY

Mobile

- React Native (Expo)

Backend (Lightweight)

- Node.js (Express)

Data

- Static / API-based stations
- No persistent DB required

APIs

- Google Maps SDK (route)
- Google Places API (stations)

PROJECT COST & TIMELINE

- Total Cost: 7500 USD**
- Total Time Line: 4 Weeks**

Project Quotation

Inclusions: Please find below the components which are inclusive in the given cost:

- Requirements Documentation: Business Proposal Document
- Project Plan
- Designing Mockups: Figma/ Adobe XD files
- Software Code via GitHub or Gitlab
- Maintenance and Support Documentation
- Test Plans and Cases
- Project Closure Report

Inclusions

- Mobile app (Android + iOS)
- Route planning (Google Maps)
- Route corridor-based station filtering
- Simplified detour estimation
- Fuel consumption + reachability logic
- Effective price-based recommendation
- QA + deployment support

Exclusions:

- Live fuel data integration
- Price prediction
- Multi-stop optimization
- User login/account
- Notifications
- Advanced analytics
- Complex detour routing (exact navigation-level)

REQUIREMENT FROM CLIENT:

Before Start

- Target geography
- Google Maps API key
- Fuel station dataset (or confirm using Google Places)

During Sprint 2

- Approval on:
 - corridor logic
 - station selection behavior

During Sprint 3

- Validation of:
 - detour estimation approach
 - fuel calculation logic

Before Deployment

- App Store & Play Store accounts

PAYMENT MILESTONE PLAN

S.No.	Milestone	Description	Total Cost (%)
1.	Milestone 1	Upfront Payment	30%

2.	Milestone 2	Upon completion of the following activities • UI/UX Designing • Basic admin panel setup • Project Plan • Database Setup	20%
3.	Milestone 3	40% of the project Completion as defined in the project plan.	20%
4.	Milestone 4	70% of the project Completion as defined in the project plan.	20%
5.	Milestone 5	Upon completion of the following activities. • Upon completion of 100% of functional modules of app development defined in the project plan • Quality Assurance Testing along with UAT • Code Delivery & product deployment on the client/live server (All 3rd party services will be subscribed by client and this payment should be release before going live)	10%

PAYMENT TERMS

- Our project manager will divide the features of each milestone once we start, into Sprints as per Agile Development methodology.
- The first milestone will be considered as an upfront payment and has to be paid by the client to officially commence the project.
- Remaining milestones have to be paid upon completion and approval of the Client.
- The payment associated with any sprint can be requested on completion of a particular sprint.

SUPPORT AND MAINTENANCE PLAN

This is the support phase where we take care of the bugs that may be raised after the final release and reported by website users. After the deployment of the project, **2 Months** of free bug removal support will be provided.

- Bug fixes: The turnaround time for bug fixes will be 24 hours or the next business day, once submitted by the client. The client is requested to provide a document containing all issues

or submit bugs at the bug tracking tool so that the respective QA team can analyze all issues, prepare test cases, and submit them to the development team. The development team will be responsible for resolving the bugs and submitting them again for testing purposes once all issues are resolved and approved by the QA team. We will submit it for client review. The turnaround time will depend on the efforts required in bug resolution. The client will be facilitated to submit bugs as many times as he can in **2 Months** support period.

- EmizenTech Pvt.Ltd and the Client can agree on a project management tool to manage the process flow like Trello, Jira, ZOHO, Asana, Basecamp, etc.
- EmizenTech Pvt.Ltd and the client can also agree on a bug tracking tool like Mantis to access and Ticket Raising Facility.
- Our response time is Monday - Friday, 10.00 – 19.00 Hours Indian Standard Time.

Paid Maintenance Package

Maintenance Package Options

- 40 Hr. for USD 800 valid for 30 Days (Suggested for small bugs and errors)
- 100 Hr. for USD 2000 Valid for 60 Days (Suggested for medium bugs and errors)
- 200 Hr. for USD 4000 Valid for 90 Days (Suggested for surveillance)

Maintenance Package includes

- Bug Fixing (crashes or errors reported by users of the application)
- Design Update
- Feature Extension
- Web and App Upgrading (for every new version launch of OS)
- Periodic Monitoring of Web and App Stats
- Server Management
- Content Updating

Terms and Conditions

- The maintenance package needs to be purchased before the completion of the project development.
- Onetime payment, no breaking down into installments. The entire amount has to be paid at the time of purchasing the package.

- The hours mentioned in the packages need to be consumed within specific period from the date of signing the contract. The period will depend on selected package.
- Once the package gets maxed out, following that, the remaining work will be carried out at an hourly price (applicable at that time) or you need to purchase another package.
- To ensure the transparency, we can use third party software called Time Doctor which will give you the ability to check the developer's screen while he is working on the task. Also, you will be updated on a very frequent basis about the number of hours spent on specific maintenance task.

Since maintenance itself seems to be a long-term working relation hence we always want to be as transparent as possible.

PAST WORK

Project Name: ArisInfra

Description: ArisInfra is a Mumbai-based technology-driven B2B platform established in 2021, aiming to revolutionize procurement in the construction materials industry. By integrating advanced technology with industry expertise, ArisInfra streamlines the sourcing and delivery of bulk materials such as aggregates, ready-mix concrete (RMC), steel, cement, and construction chemicals, serving real estate and infrastructure developers. The platform offers complete digitization with AI-assisted document management, competitive pricing through increased transparency, and instant data access via business intelligence and cloud storage. With a network of over 1,450 vendors, ArisInfra has delivered more than 10 million metric tonnes of materials across 900+ PIN codes, catering to over 2,000 customers. The company's mission is to digitize the entire supply chain, simplifying the procurement process for every stakeholder in the ecosystem.

Project Name: Caesarston

Description: Caesarstone is a leading manufacturer of premium engineered surfaces, specializing in quartz, porcelain, mineral, and natural stone materials for both residential and commercial applications. Founded in 1987 and headquartered in Israel, the company has expanded its global presence, including manufacturing facilities in the United States and India. Caesarstone's product offerings are organized into various collections, such as the Whitelight, Dark, Outdoor, and the OOAK (One of a Kind) collections, catering to diverse aesthetic preferences and functional needs. Their surfaces are known for durability, non-porosity, and resistance to scratches and stains, making them suitable for kitchens, bathrooms, and outdoor spaces. The company also provides digital tools like the Caesarstone Studio and AR Experience to assist designers and homeowners in visualizing and selecting the perfect surface for their projects. Committed to sustainability and innovation, Caesarstone continues to set industry standards in surface design and functionality.

Project Name: Chomp

Description: CHOMP is an award-winning food-saving app that helps F&B businesses reduce their unsold food surplus by listing them on our app at a discount.

"**Chomp - Food Ordering App**" is an Android application designed to facilitate food ordering from various restaurants. Users can browse through a list of restaurants in their area, view menus, place orders, and track delivery status. The app likely offers features such as secure payment options, order customization, and user reviews/ratings for restaurants. Overall, it aims to provide a convenient and efficient way for users to order food from their favorite restaurants.

App: <https://play.google.com/store/apps/details?id=com.emizen.chomp&pli=1>

Website: <https://www.chomphk.com/>

Project Name: Watch Party

Description: Watch Party is a platform that blends the live streaming engagement of Twitch, the short-form video trendsetting of TikTok, the established social features of Facebook, and the vast video library of Youtube. That's Watch Party App, your one-stop shop for creating, connecting, and discovering through live streams, short-form videos, and engaging social interactions.

App: <https://play.google.com/store/apps/details?id=com.watchparty&pli=1>

Website: <https://www.watch-party.app/>

Project Name: eFunder

Description: As an entrepreneur or the owner of a small business, you might grapple with questions like how to maintain cash flow or how to grow your startup business.

That's where eFunder's digital financing solutions can make a big difference to your working capital requirements.

This app appears to be focused on online shopping, allowing users to browse through various products and make purchases through the app. It likely offers features such as product categories, search functionality, secure payment options, order tracking, and possibly discounts or promotions.

App: <https://play.google.com/store/apps/details?id=com.efunder.ecom>

Website: <https://efunder.ai/>

Project Name: Buitanda

Description: Buitanda is the first digital B2B market in Angola. Buitanda increases the level of business between companies facilitating the purchase of wholesale products at the best price.

We have several product categories that allow you to find what you need quickly and the quality you need.

You can use Buitanda App to sell your products in large quantities and at the best price.

Use our facilities to store your products comfortably and safely. We work with the best distribution company to ensure that the products reach you within 48 hours.

Result: Boosted Sales

No Inventory Management

Increased Scalability

Flexible Business Operations

Website: <https://iraqmzad.com/>

Project Name: Kia Georgia Paint App

Description: Kia Georgia Paint App is an application for tracking and confirming quality in, out and within the paint shop. It's an ideal application for internal communication and reporting throughout the working stations including team members, group leaders, specialists and managers.

Once users downloaded the application entered their credentials (TM ID and password) they can be effortlessly connected to the data reporting transferred within the shop that falls under their specific area.

Kia Georgia Paint App features:

- Defect Reporting
- Clean Points
- Data Analysis
- Commenting
- Communication Feed
- Push Notification

To Client,

On behalf of EmizenTech, I sincerely thank you for considering our features document. We look forward to the possibility of working together and bringing this project to fruition.

Name: Virendra Sharma

Designation: CEO, Emizen Tech

Thank You!
